

# Prediction

In order to predict the scores of a programming competition and its 3rd round, we have assumed the following:

- If contestant **A** scored strictly more points than contestant **B** in each of the first two rounds, then in the third round **A** will score at least an equal amount of points as **B**.

Of course, in each round (including this one, the 3rd one) it is possible to score from 0 to 650 points. On the total ranking list, contestants are sorted descending according to the sum of points from all three rounds. The contestants with an equal sum share the same place and the next contestant gets the realistic following place. For example, contestants with sums equal to 1000, 1000, 900, 900 and 800 points win places 1, 1, 3, 3 and 5, respectively.

For each of the  $N$  contestants, we know the number of points scored in the first and second round. Given the aforementioned assumption, determine the highest and lowest place each contestant can get on the total ranking list after three rounds of this competition.

## Input

The first line of input contains an integer  $N$  ( $1 \leq N \leq 500000$ ), the number of contestants.

Each of the following  $N$  lines contains two integers from the interval  $[0, 650]$ : the number of points each contestant won in the first and second round.

## Output

For each contestant, in the order given in the input, output two integers per line: the required highest and lowest place they can get on the total ranking list.

**Sample Input 1**

5  
250 180  
250 132  
220 123  
132 194  
220 105

**Sample Output 1**

1 3  
1 3  
3 5  
1 5  
3 5

**Sample Input 2**

10  
650 550  
550 554  
560 512  
610 460  
610 456  
650 392  
580 436  
650 366  
520 456  
490 456

**Sample Output 2**

1 4  
1 8  
2 8  
2 7  
2 9  
1 10  
4 10  
1 10  
5 10  
5 10
